

# Biometric Testing

Ten minutes is all it takes to capture a snapshot  
of an employee's biometric data.

## Biometric Testing

Kersh Risk Management has developed a cost effective, time efficient system for the delivery of a mass population screening process. The standard procedure collects height/weight, blood pressure and blood chemistry from individuals at the worksite. The blood chemistry includes: Total Cholesterol, HDL Cholesterol, LDL Cholesterol, VLDL Cholesterol, Triglycerides and Glucose. This procedure can also include additional testing upon the client's request. The biometric screening takes approximately ten minutes per person causing limited workplace disruption.

The data gathered in Biometric Testing provides an accurate snapshot of an individual's health, resulting in a benchmark for intervention and increased wellbeing.
